How to model net zero emission scenarios
1. National circumstances

- What is the current target considered for reaching net zero in your country, if any? And what is the earliest date that you would consider realistic?

- What are special national circumstances (e.g. importance of basic materials industry, agriculture or population density)?

- Do you consider it is easier or harder for your country to meet net zero objective than other Member States, and why?
2. Modelling experiences

- What are experiences in your country regarding modelling (almost) net zero emissions?

- Which exchanges of materials, goods and services do you consider in your models?

- How do you treat emission offset mechanisms in your models?
